Package 'Andromeda'

May 20, 2020

Type Package
Title Asynchronous Disk-Based Representation of Massive Data
Version 0.2.0
Date 2020-05-13
Maintainer Martijn Schuemie <schuemie@ohdsi.org></schuemie@ohdsi.org>
Description Storing very large data objects on a local drive, while still making it possible to manipulate the data in an efficient manner.
License Apache License 2.0
VignetteBuilder knitr
URL https://ohdsi.github.io/Andromeda/, https://github.com/OHDSI/Andromeda
BugReports https://github.com/OHDSI/Andromeda/issues
Depends dplyr
Imports RSQLite, DBI, zip, methods, dbplyr, tidyselect, cli, pillar Suggests testthat, knitr,

andromeda

Create an Andromeda object

Description

By default the Andromeda object is created in the systems temporary file location. You can override this by specifying a folder using options(andromedaTempFolder = "c:/andromedaTemp"), where "c:/andromedaTemp" is the folder to create the Andromeda objects in.

Usage

```
andromeda(...)
```

Arguments

... Named objects. See details for what objects are valid. If no objects are provided, an empty Andromeda is returned.

Details

Valid objects are data frames, Andromeda tables, or any other dplyr table.

Value

Returns an Andromeda object.

```
andr <- andromeda(cars = cars, iris = iris)

names(andr)
# [1] 'cars' 'iris'

andr$cars %>% filter(speed > 10) %>% collect()
# # A tibble: 41 x 2
# speed dist
# <dbl> <dbl>
# 1 11 17
# ...
```

Andromeda-class 3

close(andr)

Andromeda-class The Andromeda class

Description

The Andromeda class is an S4 object.

This class provides the ability to work with data objects in R that are too large to fit in memory. Instead, these objects are stored on disk. This is slower than working from memory, but may be the only viable option.

Show the names of the tables in an Andromeda object.

Usage

```
## S4 method for signature 'Andromeda'
show(object)
## S4 method for signature 'Andromeda'
x$name
## S4 replacement method for signature 'Andromeda'
x$name <- value
## S4 replacement method for signature 'Andromeda'
x[[i]] \leftarrow value
## S4 method for signature 'Andromeda'
x[[i]]
## S4 method for signature 'Andromeda'
names(x)
## S4 method for signature 'Andromeda'
length(x)
## S4 method for signature 'Andromeda'
close(con, ...)
```

Arguments

object	An Andromeda object.
x	An Andromeda object.
name	The name of a table in the Andromeda object.
value	A data frame, Andromeda table, or other 'DBI' table.
i	The name of a table in the Andromeda object.
con	An Andromeda object.
• • •	Included for compatibility with generic close() method.

4 appendToTable

Value

A vector of names.

Tables

An Andromeda object has zero, one or more tables. The list of table names can be retrieved using the names() method. Tables can be accessed using the dollar sign syntax, e.g. andromeda\$myTable, or double-square-bracket syntax, e.g. andromeda[["myTable"]]

Permanence

To mimic the behavior of in-memory objects, when working with data in Andromeda the data is stored in a temporary location on the disk. You can modify the data as you can see fit, and when needed can save the data to a permanent location. Later this data can be loaded to a temporary location again and be read and modified, while keeping the saved data as is.

Inheritance

The Andromeda inherits directly from SQLiteConnection. As such, it can be used as if it is a SQLiteConnection. RSQLite is an R wrapper around 'SQLite', a low-weight but very powerful single-user SQL database that can run from a single file on the local file system.

See Also

```
andromeda()
```

Examples

```
andr <- andromeda(cars = cars, iris = iris)
names(andr)
# [1] 'cars' 'iris'
close(andr)</pre>
```

appendToTable

Append to an Andromeda table

Description

Append a data frame, Andromeda table, or result of a query on an Andromeda table to an existing Andromeda table.

If data from another Andromeda is appended, a batch-wise copy process is used, which will be slower than when appending data from within the same Andromeda object.

Important: columns are appended based on column name, not on column order. The column names should therefore be identical (but not necessarily in the same order).

Usage

```
appendToTable(tbl, data)
```

batchApply 5

Arguments

An Andromeda table. This must be a base table (i.e. it cannot be a query result).

The data to append. This can be either a data.frame or another Andromeda table.

Value

Returns no value. Executed for the side-effect of appending the data to the table.

Examples

```
andr <- andromeda(cars = cars)
nrow(andr$cars)
# [1] 50
appendToTable(andr$cars, cars)
nrow(andr$cars)
# [1] 100
appendToTable(andr$cars, andr$cars %>% filter(speed > 10))
nrow(andr$cars)
# [1] 182
close(andr)
```

batchApply

Apply a function to batches of data in an Andromeda table

Description

Apply a function to batches of data in an Andromeda table

Usage

```
batchApply(tbl, fun, ..., batchSize = 1e+05, safe = FALSE)
```

Arguments

tbl An Andromeda table (or any other 'DBI' table).

fun A function where the first argument is a data frame.

... Additional parameters passed to fun. batchSize Number of rows to fetch at a time.

safe Create a copy of tbl first? Allows writing to the same Andromeda as being read

from.

Details

This function is similar to the lapply() function, in that it applies a function to sets of data. In this case, the data is batches of data from an Andromeda table. Each batch will be presented to the function as a data frame.

6 batchTest

Value

Invisibly returns a list of objects, where each object is the output of the user-supplied function applied to a batch

Examples

```
andr <- andromeda(cars = cars)

fun <- function(x) {
   return(nrow(x))
}

result <- batchApply(andr$cars, fun, batchSize = 25)

result
# [[1]]
# [1] 25
#
# [[2]]
# [1] 25
close(andr)</pre>
```

batchTest

Apply a boolean test to batches of data in an Andromeda table and terminate early

Description

Apply a boolean test to batches of data in an Andromeda table and terminate early

Usage

```
batchTest(tbl, fun, ..., batchSize = 1e+05)
```

Arguments

tbl An Andromeda table (or any other 'DBI' table).

fun A function where the first argument is a data frame and returns a logical value.

... Additional parameters passed to fun. batchSize Number of rows to fetch at a time.

Details

This function applies a boolean test function to sets of data and terminates at the first FALSE.

Value

Returns FALSE if any of the calls to the user-supplied function returned FALSE, else returns TRUE.

copyAndromeda 7

Examples

```
andr <- andromeda(cars = cars)
fun <- function(x) {
   is.unsorted(x %>% select(speed) %>% collect())
}
result <- batchTest(andr$cars, fun, batchSize = 25)
result
# [1] FALSE
close(andr)</pre>
```

copyAndromeda

Copy Andromeda

Description

Creates a complete copy of an Andromeda object. Object attributes are not copied.

Usage

```
copyAndromeda(andromeda)
```

Arguments

andromeda

The Andromeda object to copy.

Value

The copied Andromeda object.

```
andr <- andromeda(cars = cars, iris = iris)
andr2 <- copyAndromeda(andr)

names(andr2)
# [1] 'cars' 'iris'

close(andr)
close(andr2)</pre>
```

8 groupApply

groupApply

Apply a function to groups of data in an Andromeda table

Description

Apply a function to groups of data in an Andromeda table

Usage

```
groupApply(tbl, groupVariable, fun, ..., batchSize = 1e+05, safe = FALSE)
```

Arguments

tbl An Andromeda table (or any other 'DBI' table).

groupVariable The variable to group by

fun A function where the first argument is a data frame.

... Additional parameters passed to fun.

batchSize Number of rows fetched from the table at a time. This is not the number of rows

to which the function will be applied. Included mostly for testing purposes.

safe Create a copy of tbl first? Allows writing to the same Andromeda as being read

from.

Details

This function applies a function to groups of data. The groups are identified by unique values of the groupVariable, which must be a variable in the table.

Value

Invisibly returns a list of objects, where each object is the output of the user-supplied function applied to a group.

```
andr <- andromeda(cars = cars)

fun <- function(x) {
   return(tibble::tibble(speed = x$speed[1], meanDist = mean(x$dist)))
}

result <- groupApply(andr$cars, "speed", fun)
result <- bind_rows(result)
result
# # A tibble: 19 x 2
# speed meanDist
# <dbl> <dbl>
# 1 4 6
# 2 7 13
# 3 8 16
# ...

close(andr)
```

isAndromeda 9

isAndromeda

Check whether an object is an Andromeda object

Description

Check whether an object is an Andromeda object

Usage

isAndromeda(x)

Arguments

Х

The object to check.

Details

Checks whether an object is an Andromeda object.

Value

A logical value.

isValidAndromeda

Check whether an Andromeda object is still valid

Description

Check whether an Andromeda object is still valid

Usage

isValidAndromeda(x)

Arguments

Χ

The Andromeda object to check.

Details

Checks whether an Andromeda object is still valid, or whether it has been closed.

Value

A logical value.

10 loadAndromeda

Examples

```
andr <- andromeda(cars = cars, iris = iris)
isValidAndromeda(andr)
# TRUE
close(andr)
isValidAndromeda(andr)
# FALSE</pre>
```

loadAndromeda

Load Andromeda from file

Description

Load Andromeda from file

Usage

loadAndromeda(fileName)

Arguments

fileName

The path where the object was saved using saveAndromeda().

Value

An Andromeda object.

See Also

saveAndromeda()

```
# For this example we create an Andromeda object and save it to
# a temporary file locationL
fileName <- tempfile()
andr <- andromeda(cars = cars)
saveAndromeda(andr, fileName)

# Using loadAndromeda to load the object back:
andr <- loadAndromeda(fileName)

# Don't forget to close Andromeda when you are done:
close(andr)

# Cleaning up the file used in this example:
unlink(fileName)</pre>
```

restoreDate 11

restoreDate

Restore dates

Description

Restores dates that were converted by Andromeda to numeric values back to dates.

Usage

```
restoreDate(x)
```

Arguments

Х

A numeric vector representing dates.

Value

A vector of type Date.

Examples

```
myData <- data.frame(startDate = as.Date(c("2000-01-01", "2001-01-31", "2004-12-31")))
andr <- andromeda(myData = myData)

andr$myData %>%
    collect() %>%
    mutate(startDate = restoreDate(startDate))
# # A tibble: 3 x 1
# startDate
# <date>
# 1 2000-01-01
# 2 2001-01-31
# 3 2004-12-31

close(andr)
```

 ${\tt restorePosixct}$

Restore timestamps

Description

Restores dates that were converted by Andromeda to numeric values back to dates.

Usage

```
restorePosixct(x)
```

Arguments

Х

A numeric vector representing timestamps

12 saveAndromeda

Value

A vector of type POSIXct.

Examples

saveAndromeda

Save Andromeda to file

Description

Saves the Andromeda object in a zipped file. Note that by default the Andromeda object is automatically closed by saving it to disk. This is due to a limitation of the underlying technology ('RSQLite'). To keep the connection open, use maintainConnection = TRUE. This will first create a temporary copy of the Andromeda object. Note that this can be substantially slower.

Usage

```
saveAndromeda(
  andromeda,
  fileName,
  maintainConnection = FALSE,
  overwrite = TRUE
)
```

Arguments

andromeda An object of class Andromeda.

fileName The path where the object will be written.

 ${\tt maintain} \\ {\tt Connection}$

Should the connection be maintained after saving? If FALSE, the Andromeda $\,$

object will be invalid after this operation, but saving will be faster.

overwrite If the file exists, should it be overwritten? If FALSE and the file exists, an error

will be thrown.

saveAndromeda 13

Value

Returns no value. Executed for the side-effect of saving the object to disk.

See Also

```
loadAndromeda
loadAndromeda()
```

```
andr <- andromeda(cars = cars)

# For this example we'll use a temporary file location:
fileName <- tempfile()

saveAndromeda(andr, fileName)

# Cleaning up the file used in this example:
unlink(fileName)</pre>
```
